Color Variation Statement

Stainless Steel Electropolish E972 electropolishing electrolyte for stainless steel

November 14, 2022

The raw materials (acids) used in the production of Stainless Steel Electropolish E972 have variation in color consistency. This has caused the product to vary in color which is close to clear to a light brown or amber color. This color change has no impact on the performance of the solution as the raw materials used have not changed in chemical composition. All raw materials are verified with certification from our suppliers and the formulation and mixing procedures have not changed for E972.

Due to this inconsistency, we have modified our SDS sheet to reflect this color variation. The new SDS sheet will state that the color of the solution is "Light amber to light brown". The range of color from light amber to light brown is acceptable.
